

Moosa Numan's Even Prime Rule.

The Core Rule: Every even number ($2X$) is constructed by the sum of two prime numbers ($P1 + P2$).

The Synchronization: Prime numbers are not random. They have a perfectly timed, predictable rhythm over an infinite runway.

The Infinite Supply: Because this runway is infinite, you will always have an infinite supply of prime building blocks for any even target.

The Grid Trap: Non-primes are trapped in rigid repeating mathematical grids, so they literally run out of space to block the dense wave of incoming primes.

The Final Collision Because the prime waves are infinite and locked in synchronicity, they are mathematically compelled to collide on your even number every time. Thus, my rule becomes an unbreakable law of the universe.
